Sanger Xenopus troppicalis EST/CDNA project.
This sequence is from a Kenopus Gene Collection (XGC) library, from a library constructed by Aaron M. Zorn. CDNA was prepared from RNA extracted from gastrula embryos. EcoRI-NotI cut cDNA was then ligated into pCS107 with EcoRI at the 5' end and NotI at the 3' end.
                                                                                                                                                                                                                                                                    Xenopus tropicalis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Custom primers were used for 5' and 3'-end sequencing. The full-insert sequencing was done by primer-walking method using ABI DNA sequencer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo sapiens 5T4 oncofetal trophoblast glycoprotein gene. AJ012159.
5T4 Gene; 5T4 oncofetal trophoblast glycoprotein. Homo sapiens (human)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 linear

Clone requests: clonerequest@sanger.ac.uk

On Dec 15, 2000 this sequence version replaced gi:11558491.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORWPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromesome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.aanger.ac.uk/HGP/Chr6

RRD: 492P14 is from the library RPCI-3 constructed by the group of Pieter de Jong. Por further details see http://www.chori.org/bacpac/home.htm

VECTOR: pCYPAC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HSJ492P14 12-MAY-2005
Human DNA sequence from clone RP3-492P14 on chromosome 6q13-15
Contains a single stranded DNA binding protein pseudogene, the TPBG
gene for trophoblast glycoprotein (5T4-AG) and a CpG island,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 00); an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by at least one subclone; and the assembly was confirmed by restriction digest,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

as compressions and repeats; all regions were covered by at least one plasmid subclone, fosmid clone or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The assembly was confirmed by restriction digest.

This finishing standard has slightly changed from the previous Human standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              If a sequence meets the criteria of the above statement, it needs no comments or tags. If the criteria are not met, such as ambiguous bases, then the region is duly annotated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Direct Submission

On Nov 19, 2002 Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, Expense and Whole Genome Shotgun Sequence ordered as scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold by Sized gaps filled with NS to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of Whole genome Shotgun sequence reads. Both end sequences and Whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Web site: http://www.hgsc.bcm.tmc.edu/

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COMMENT
                                                                               NOTE: Bstimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.
This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ACLUSS62 239076 bp DNA linear HTG 20-NOV-2002

Direct Submission

Submitted (20-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 20, 2002 this sequence version replaced gi:22857070.

The sequence in this sequencing reads assembled using Atlas and whole genome shotgun sequencing reads assembled using Atlas and whole genome shotgun sequencing reads assembled using Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequence and whole genome shotgun sequence reads. Both end sequence and whole genome shotgun sequence contigs will be indicated in the feature Calderon, B. Bryant, N., Buhay, C., Burch, P., Burrell, K., (bases 1 to 239076) Worley, K.C. Direct Submission Unpublished

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                  * NOTE: This is a 'working draft' sequence. It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                               12531: contig of 12531 bp in length 12631: gap of 100 bp 17456: contig of 4825 bp in length 17556: gat of 100 bp 19714: contig of 2158 bp in length 19814: gap of 100 bp 26971: gap of 100 bp 31635: contig of 4664 bp in length 26971: gap of 100 bp 31735: gap of 100 bp 37319: contig of 5584 bp in length 37419: gap of 100 bp 53243: contig of 5584 bp in length 37419: gap of 100 bp 53243: contig of 100 bp 532443: contig of 100 bp 542443: contig of 100 bp 542443: contig of 100 bp 5424443:

Clone Sep 9, 2000 this sequence version replaced gi:9943980.

The following abbreviations are used to associate primary accession numbers given in the feature table with thair source databases:
Bm:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence was generated from part of bacterial clone contigs of human achromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AL139114 13-MAY-2005
Human DNA sequence from clone RP11-328C23 on chromosome

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, B., Tateno, M., Catenses, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8 The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute (http://bacpac.med.buffalo.edu)
VECTOR: pBACe3.6
NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is AL353584; the clone sequenced to the right is AC020674. Actual start of this clone is at base position 1 of RP11-462H12; actual end is at base

McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30; an attempt was made to resolve all sequencing problems, such as compressions and repeats, all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                Direct Submission
Submitted (09-MAY-2001) Department of Genetics, Washington

                                                                                                                                                                                                                                                                                                                                                                                                                                           * NOTE: This record contains 84 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            f 100 bp

```
The invention relates to a method of inhibiting a cancerous phenotype of a cell comprises contacting a cancerous mammalian cell with an agent for inhibition of DKF2psG611313 activity. The methods are useful for treating cancer, e.g. breast cancer. This sequence represents a gene product which is differentially expressed in breast cancer cells. The sequence can be
                                                                                                    Inhibiting a cancerous phenotype of a cell, useful for treating breast cancer comprises contacting a cancerous mammalian cell with an agent for inhibition of DKFZp5661133 activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                therapy; expression profile; solid tumour; mononuclear cell; PBMC; prognosis; ds.

The invention describes a method comprising comparing an expression profile of at least one gene, where the fast one reference expression profile of the at least one gene, where the patient has a solid tumour, and each of the gene is differentially expressed in peripheral blood monomclear cells (PBMGs) of a first class of patients as compared to PBMGs of a second class of patients, where cot patients as compared to PBMGs of a second class of patients, where cot patients and second classes of patients have the solid tumour, and where the majority of the first class of patients has a first clinical outcome, and patients who have the solid tumour, and where the majority of the first class of patients has a second clinical outcome. Also described are: a system comprising (i) a memory or a cutcome. Also described are: a system comprising (i) a memory or a storage medium including data that represent an expression profile of at class one gene in a peripheral blood sample of a patient who has a solid tumour, (ii) at least another storage medium including data that the expression profile of the reference expression profile, and (iv) a processor capable of executing the companies on profile, and (iv) a processor capable of executing the companies on profile, and (iv) a processor capable of executing the class of patients where solid tumour prognosis genes is differentially expressed in thical outcomes of the patients; and an another accord class of patients as compared to pages. Where comprising outcomes of the patients; and an another expression profile of patients and except of protein array are useful for prognosis genes of patients and second class of patients and second class of patients as compared to page.

The method, system, and array are useful for prognosing and treating gene of the invention. Note: The sequence data for this pateent dat not form part cot the invention. Note: The sequence data for this

                                    The present sequence encodes the canine 5T4 tumour-associated antigen (TAA). The TAA 5T4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 5T4 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been human or murine 5T4 gene sequence. The 5T4 antigen to octor containing the human or murine 5T4 gene sequence. The 5T4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used
                                                                                                                                                                              elicit an immune response, preferably CTL or an antibody response in a

cancer nucleic acids.

```
The invention comprises a method of detecting a breast cancer-associated transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that hybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the diagnosis or prognosis of breast cancer calls dor detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the method of the invention can be used in diagnostic purposes and also as targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are over or under expressed in breast cancer can additionally provide high resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics, drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABTO763 - ABTO7761 represent the 69 breast cancer-associated gene sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Iung cancer-associated polynucleotide, gene, ds, cytostatic, emphysema, antiinflammatory, antiasthmatic; non-small cell lung cancer; atelectasis; small cell lung cancer; benign lesion; precancerous lesion; bronchitis; chronic obstructive pulmonary disease; hypersensitivity pneumonitis; interstitial pulmonary fibrosis; fibrosis; asthma; bronchiectasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         THE X DESCRIPTION OF THE SECRET SECTION OF THE SECT
```

```
transcript in a cell from a patient, comprising cancering a biological sample from the patient with a polymucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer caspociated polymucleotides and polypeptides are used for identifying a compound that modulates a lung cancer—associated polypeptide, for inhibiting proliferation of a lung cancer—associated polypeptide, for inhibiting proliferation of a lung cancer—associated polypeptide, for inhibiting proliferation of a lung cancer—associated polypeptide, for cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful cor treating lung cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis The genes, polyuncleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences
                                                                                    The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological
patient with a polynucleotide that exhibits increased or decreased expression in lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cytostatic; gene therapy; vaccine; ovarian cancer; diagnosis; post-operative chemotherapy; radiation therapy; tumour prognosis; pre-cancerous lesion detection; ds; gene.

```
Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                     The invention relates to a method of detecting an ovarian cancer-
sasociated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polynucleotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
in diagnosing ovarian cancer and in identifying and using agents and/or
targets that inhibit ovarian cancer. The nucleic acid molecule,
polypeptide and the antibody may also be used in detecting ovarian
cancers, monitoring and early detection of relapse following treatment,
monitoring response to therapy, selecting patients for post-operative
chemotherapy or radiation therapy, in selecting mode of therapy,
and as vaccines. This sequence corresponds to one of the mucleic acids
used for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; differential expression; cancer; angiogenic disorder; fibrotic disorder; psoriasis; ischaemia; heart disease; atherosclerosis; inflammatory disease; autoimmune disease; retinal neovascularistaion syndrome; scarring; uterine fibroid; detection; diagnosis; prognosis; drug screening; drug targeting; wound healing; contraception; cytostatic; cardiant; immunomodulatory; vulnerary; gene therapy; vaccine; gene; ss.

DB:
The invention relates to mucleic acids and proteins (ADN38683-ADN40064)

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a confident by defecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and mucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, attenned other conditions such as psoriasis, ischaemia, heart disease, attenned other conditions such as psoriasis, ischaemia, heart disease, attenned other conditions such as soriasis, include the may necessary diseases, autonoment diseases, attenned the acids in wound healing and in contraception. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                         Gish KC, Glynne R, Hevezi PA;

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent agent and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA Human, anti-HIV; cytostatic; antidiabetic; antiasthmatic; cachexia; AIDS; antiinflammatory; cardiant; haemostatic; neuroprotective; anorectic; notropic; immunosuppressive; osteopathic; antiparkinsonian; cancer; antiinfertiilty; rerebroprotective; gene therapy; NOVX; NOV; fertility; metabolic disorder; dlabetes; obesity; infectious disease; anorexia; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; cardiovascular disorder; Sequence 973 BP; 203 A; 308 C; 254 G; 208 T; 0 U; 0 Other; 60000 60000 Conservative: Mismatches: Indels: Gaps: Length: Matches: 763 GCCCTGATAGGCGCTATTTTCCTCCTG 789 o 1 AlaLeuileGlyAlailePheLeuLeu US-10-774-176-6 (1-9) x AAD56198 (1-973) ABV99349 standard; DNA; 1156 Human NOV8a coding sequence. The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99127-ABV99555 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or disquences and proteins are useful for treating, preventing or disquences and proteins are useful for treating, concer, neurodegenerative disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's disease, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disturbances associated with obesity, metabolic syndrome X or wasting disorders associated with chronic diseases or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and anglogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or disagnostic methods
                                                                       Rastelli L, Mezes PD, Smithson G, Guo X, Gerlach V, Casman SJ; Boldog FL, Li L, Zerhusen BD, Tchernev VT, Gangolli RA, Vernet CAM, Pena CEA, Burgess CE, Liu X, Spytek RA, Gorman L, Spaderna SK; Voss EZ, Malyankar UM, Anderson DW, Patturajan M, Miller CE, Taupier RJ, Padigaru M, Shenoy SG, Kekuda R, Gusev VY, Pochart PF;
                                                                                                                                                                                                                    New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer, Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic disorders, and asthma.

```
The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the professed leucine-rich glycoproteins known as 574, and the polynucleotide sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell proliferation, infections, and inflammatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, tisgues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The protein are useful for isolating foetal cells from maternal blood. The cells may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es). The present sequence encodes feline 574 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polypeptide, useful in preparation of vaccine for treating preventing cancer in a subject, preferably a dog or cat.

The invention relates to a novel Major Histocompatibility Complex (WHC) class I peptide epitope of the 574 antigen. The invention further class I peptide epitope string comprising the 574 epitope; a uncleic acid sequence encoding the 574 epitope or a polyepitope string of the 574 cpitope; a vector system capable or a polyepitope string of the 574 epitope is a cell pulsed with the 574 epitope, a polyepitope of the 574 epitope, its encoding nucleic acid, or the vector system; a vaccine comprising the above; a method for treating and/or preventing a disease or a pubject by administering the vaccine; an agent capable of binding specifically to the 574 epitope and/its encoding nucleic acid; a method comprising detecting the presence of the 574 epitope or its encoding nucleic acid in a subject; and a T cell line or clone capable of specifically recognishing the 574 epitope in conjunction with an WHC class or specifically recognishing the 574 epitope in conjunction with an except system or cell is useful in the prevention and/or treatment of a disease, comprising the 574 epitope or its encoding nucleic acid and the vector of particularly cancer. The detection method is useful for diagnosing or particularly cancer. The detection method is useful for diagnosing or presence of the 574 epitope or its nucleic acid. The T cell line or clone controlled in the manufacture of a medicament for treating and/or preventing a disease. This polynucleotide sequence represents the felline correct of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New major histocompatibility complex class I peptide epitopes from human 5T4 tumor-associated antigen, useful for preventing and/or treating a disease, particularly cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           179

5T4 tumour-associated antigen gene.

Human

```
Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.
The invention relates to a Major Histocompatibility Complex (MHC) class of II peptide epitope of the 5T4 antigen. The vaccine or T-cell line or clone has a cytostatic activity, as it is useful in manufacturing a medicament for preventing and/or treating a disease, particularly cancer. The methods are useful for detecting T-cells capable of specifically recognishing a peptide epitope in conjunction with an MHC molecule, for disgnosing or monitoring the presence of a peptide connucleic acid using an agent. The MHC class II peptide epitope of the invention can be used in gene therapy or as part of a vaccine. This polymucleotide sequence represents the DNA coding for the feline 5T4 protein.
                                                                                                                                gene; ds; feline; Major Histocompatibility Complex class II; MHC; epitope; 5T4 antigen; vaccine; T-cell; cytostatic; cancer; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Major Histocompatibility Complex class II peptide epitope of 574, useful for manufacturing a medicament for diagnosing, preventing and/or treating a disease, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1260 BP; 221 A; 451 C; 346 G; 241 T; 0 U; 1 Other;

CTAA). The TAA ST4 is a glycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metaetessis in colorectal and gastric cancer. ST4 antigen may be therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours had been induced were inoculated with a virus expression vector containing the present sequence. The ST4 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single chain antibody, ScPv; inflammatory disease; arthritis; cancer; hypersensitivity; autoimmune disease; central nervous system disorder; Parkinson's disease; periodontal disease; cardiopulmonary disease; cardiovascular disease; gastrointestinal disorder; infection; diabetes; Helicobacter-related disease; immune disorder; ss.

The present invention relates to the isolation of canine and feline oncofoetal leucine-rich glycoproteins known as 574, and the concofoetal leucine-rich glycoproteins known as 574, and the polynuclocides sequences encoding them. The 574 proteins are expressed in a significant proportion of tumours. The sequences of the invention are useful in a pharmaceutical composition for the prevention and/or treatment of tumours or other diseases associated with cell conformation in facing the conformatory conditions in animals, preferably dogs or cats. The compositions may also be used for cancer immunotherapy in these animals. The sequences of the invention may also be used in diagnostic kits for rapid, reliable, sensitive, and specific measurement and localisation of 574 in extracts of plasma, urine, tissues, and in cell culture media. Antibodies specific for the 574 protein are useful for isolating foetal cells from maternal blood. The protein are useful for isolating foetal cells from maternal blood. The coll call may then be subject to biochemical or genetic sampling used for testing foetal abnormalities, or to determine the sex of the foetus(es).

The present sequence encodes canine 574 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel canine or feline 5T4 polypeptide and polynucleotides encoding the polypeptide, useful in preparation of vaccine for treating and/or preventing cancer in a subject, preferably a dog or cat.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes the use of a single chain antibody (ScFv), which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the prevention and treatment of a disease condition. The ScFv antibody is useful in the manufacture of a medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. The ScFv antibody is also useful for treating inflammatory diseases including arthritis, hypersensitivity, autoimmune diseases, cancers, central nervous system disorders including Parkinson's disease, partidontal diseases, cardiopulmonary diseases, cardiovaccular diseases, gastrointestinal disorders, infections, diabetes, Helicobacterelated diseases, and other immune disorders. The present sequence encodes a 574 protein, which is used to produce ScFv of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of single chain antibody capable of recognizing a disease associated molecule for manufacturing a medicament for preventing and/or treating a disease condition associated with disease associated molecule.

The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS related DNA
                                                                                                                                                                                                                                                                                                                                                                          Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence encodes the mouse 574 tumour-associated antigen carcinomas but has a lycoprotein which is widely expressed in carcinomas but has a highly restricted expression pattern in normal adult tissues. It appears to be strongly correlated to metastasis in colorectal and gastric cancer. 574 antigen may therefore be useful in tumour diagnosis, targeting and immunotherapy. Mice in which tumours aben induced were inculated with a virus expression vector containing the present sequence. The 574 antigen was shown to be effective at eliciting an immunotherapeutic anti-tumour response. Both the nucleic acid encoding the antigen and the antigen itself can be used to elicit an immune response, preferably CTL or an antibody response in a subject. The present sequence appears in GenBank at accession number AJ012160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tumor associated antigen, 5T4 capable of eliciting cytotoxic T-lymphocyte response useful in vaccinating against and in treating tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polymouleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protoconcedent is amplified in neuroblastoms cells and is common in small concers. The present invention describes these cDNA molecules cas useful for in hybridisation assays to detect expression of nucleic cids (or complementary nucleic acids) in a present in a given sample, as specifically bind the cDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polymouleotide sequence is a cDNA that is differentially expressed in MYCN activated cells, given in an exemplification of the invention. NOTE: This sequence does not appear in the DYA patent Office at
                                                                                                                   New genes regulated by MYCN activation, useful in gene therapy, particularly for treating a subject with e.g. neuroblastoma or other cancers, or for diagnosing, staging or monitoring the treatment of the

The present invention describes a method for detecting a bladder cancerassociated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is 80 % identical to a table of sequences (see ACC50951 to ACC5095). ACC50951 to ACC51059 encode the human bladder cancerassociated proteins given in ABR48146 to ABR48342). Bladder cancerassociated sequences from the present invention have cytostatic activities, and can be used in antisense gene therapy and in vaccine production. The method can be used for detecting a bladder cancerassociated transcript in a cell from a patient. The method is useful in diagnosing or treating bladder cancer and in screening for compounds that modulate bladder cancer and in screening and diagnostic methods, and for gene therapy, vaccine
